                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      INSPOOSA. This protein is a metalloprotease, specifically a choriolysin/astacin-like metalloprotease. The INSPOOS polypetides and conclete acid molecules of the invention are useful in the therapy or diagnosis of diseases or in the manufacture of a medicament for the treatment of a disease, such as a respiratory disorder, including emphysema and cystic fibrosis, a metabolic disorder, a cardiovascular disorder, a bacterial infection, hypertension, a proliferative disorder, including cancer, an autoimmune/inflammatory disorder, including rheumatoid arthritis, a neurological disorder, a developmental disorder, a reproductive disorder or other pathological condition in which

Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation

Claim 10; Page 1545; 2508pp; English.

designated ORF (open reading frame) 1-454, and sequences ABN75054ABN79587 represent cDNAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORFT-ORF4534 (collectively referred to as ORFX) proteins, polymcleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polymcleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX proteins, antibodies opportific for ORFX proteins, methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, timmune modulation, haematopoiesis regulation, cell differentiation, immune modulation, haematopoiesis regulation, cissue growth anglogenesis, activin, haematopoiesis regulation, cemokinetic activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, on the coll of cancers, on the coll of and antinfective activity, and may also be involved in the treatment of cancers, on the coll of t ester other proliferative disorders such as psoriasis and benign tumours, neurological disorders such as epilepsy and Alzheimer's disease, cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage disease, and infectious diseases caused by viral, bacterial, fungal and other pathogens. OREX nucleic acids may also be used as a source of primers and probes, in the detection of OREX genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The OREX nucleic acids may additionally be used to produce transgenic animals Sequences ABP31028-ABP35561 represent 4534 novel human proteins

                                                                                                                                                                                                                                                                                                                                                                                                       Human, brain expressed exon, gene expression analysis, probe, microarray, Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy, cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                         Human brain expressed single exon probe encoded protein SEQ ID NO: 29307.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single exon nucleic acid probes for analyzing gene expression in human
which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the diagnosis, treatment and monitoring of ORFX-associated diseases
                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhoosis, hyperlipideaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at from Letp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                            Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 25; DB 4; Length 76; 100.0%; Pred. xx sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The sequences ABA08225-ABA09574 represent nucleic acids encoding them. The sequences ABA08225-ABA09574 represent nucleic caids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of identifying compounds which bolypeptides against the polypeptides, methods of identifying compounds which bolypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activities, and hence cytomeration activities; stem cell growth factor activities; core chemology to crementated activities; chemology core chemology activity; activity; itsue growth activity; including cytokine, cell proliferation or cell functions or chemology activities, hemostactic or may be comparated activities; corporated activities; corporated activities; corporated activities; corporated activities; corporated activities; corporated activities, polypeptides and nucleotides of the involution are useful for preventing, treating or amelicating cell conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions in admining cell and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound immunomodulatory activities may be used in the treatment of viral, immunomodulatory activities may be used in the treatment of viral, immunomodulatory activities may be used in cell cultures to belypeptides with growth factor activity may be used in cell culture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 20; Page 238; 1963pp; English.

                              manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention

protein. The GCRECs are used for treating or preventing disorders associated with decreased expression of functional GCREC, and for identifying specific agonists and antagonists, also binding agents and outleters. Also binding agents and outleters. They can also be used for generating specific antibodies and for proteosome analysis. Disorders that can be treated include cell proliferative disorders, e.g., arteriosclerosis and cancer, neurological disorders, e.g., atherosclerosis and congestive heart cardiovascular disorders, e.g., atherosclerosis and congestive heart failure, gastrointesfinal disorders, e.g., acquired immunofintlammatory disorders, e.g., acquired immunodeficiency syndrome (AIDS) and anaemia, metabolic disorders, e.g., diabetes and obesity and viral infections. Nucleic acids that encode GCREC are used to identifying agents that alter its expression, for assessing toxicity of test compounds, and as sources of primers and probes for diagnostic detection of GCREC DNA and of therapeutic antisense and riboscme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
              New human G-protein coupled receptors, useful for treatment and diagnosis of e.g. cell proliferation, also screening for specific modulators, and related nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                        sequences. They can also be used in gene therapy, for chromosomal mapping, and for recombinant production of GCREC. The antibodies are useful for diagnosis and monitoring of diseases associated with GCREC expression, for detecting and purifying GCREC, and as therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, olfactory receptor; OR; primary scent determination; secondary scent determination; polypeptide library; odour receptor; scent profile; scent fingerprint; scent representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yanai I;

New polynucleotides which encode polypeptides involved in olfactory

```
The present sequence is an olfactory receptor which is encoded by one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour

```
The present sequence is a polypeptide encoded by one of 344 newly mined human genes. It was used as a query sequence in a database search of olfactory receptor (OR)-like sequences. The invention relates to isolated polymucleotides encoding polypeptides involved in olfactory sensation. The polymucleotides can be used in screening for olfactory agonists and antapolists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of elfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; olfactory receptor; OR; primary scent determination; secondary scent determination; polypeptide library; odour receptor; scent profile; scent fingerprint; scent representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotides which encode polypeptides involved in olfactory sensation for identifying olfactory agonists and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yanai I;

The invention relates to isolated polymucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridisation probes, polymerase chain

reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
and in recombinant production of (II). The polymucleotides are also used
in diagnostics as expressed sequence tags for identifying expressed
c in diagnostics as expressed sequence tags for identifying expressed
c extivity of (II) is useful in gene therapy techniques to restore normal
c useful for generating antibodies against it, detecting or quantitating a
c useful for generating antibodies against it, detecting or quantitating a
c useful for supplement. (II) and its binding partners are useful in medical imaging
c supplement. (II) and its binding partners are useful for treating disorders
involving aberrant protein expression or biological activity. The
c polypeptide and polymucleotide sequences have applications in
diagnostics, forensics, gene mapping, identification of mutations
                                                                                                                                                                                                                                                                                  ô
receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different individuals
                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   forensic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, chromosome mapping; gene mapping; gene therapy; forensic

This antibody is directed against a human factor VIII inhibitory antibody furcted towards the C2 domain of Factor VIII. The anti-idiotypic antibody is characterized by comprising complementarity determining regions (CDRs) given in ADL73176-ADL73181, and by having the capacity to neutralize by at least 50% the inhibition of FVIII procoagulant activity mediated by inhibitory antibodies against the C2 domain of FVIII. The anti-idiotypic antibodies of the invention may be used to treat, prevent or reduce bleeding disorders of haemophilia
                              and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid derived from Enterococcus faecium monoding an Enterococcus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid operably linked to chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for disagnosing pathological conditions of resulting from E. faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans on nucleic acid is useful for recombinant production of Candida albicans and vaccines containing the nucleic acid ace useful for preventing or treating Enterococcus faecium infections. The present sequence represents
                                                                                                                                ö

The encoding cDNA is contained in plasmid designated plolP3All deposited with ATCC as Accession No.PTA-312. PHOR-1 polypeptides and polymucleotides are useful for diagnosing the presence of cancer, especially prostate, kidney, uterine, cervical, stomach or rectal cancer by determining and comparing the level of the protein or mRNA expression in test and normal tissue samples. Pharmaceutical compositions comprising PHOR-1 is useful for treating cancer. PHOR-1 proteins are useful for identifying ligands and other agents and cellular constituents that binds to PHOR-1 gene product and for generating antibodies which are useful in diagnostic, prognostic and imaging methodologies and for the treatment of prostate cancer. Cell inse expressing PHOR-1 are useful for identifying protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. 167

(1) have cytostatic, antiarteriososlerotic, antiallergic, antialtarteriososlerotic, antiallergic, antiallergic and thyromimetic activities, and can be useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of PMMM, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. applepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. hypothyroidism, Cubhing's syndrome) disorders, or infections. They are also useful in assessing the effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hafalia AJA,

of exogenous compounds on the expression of nucleic acid and amino acid sequences of PMMM. The PMMMMs or their fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or medulate the activity of the polypeptide. The microarray is useful in monitoring or measuring protein-protein interactions, drug-target interactions, and gene expression profiles

"A new member to the astacin family of metalloendopeptidases: a novel
1,25-dihydroxyvitamin D-3-stimulated mRNA from chorioallantoic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        membrane of quall.";
Biochim. Biophys. Acta 1217:1-8(1994).
-!- FUNCTION: May play a role in the degradation of eggshell matrix.
-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
-!- INDUCTION: By 1,25-dihydroxyvitamin D-3.
-!- SIMILARITY: Belongs to peptidase family M12A.
-!- SIMILARITY: Contains 1 CUB domain.
SIMILARITY: Belongs to the eukaryotic-type carbonic anhydrase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CARBONIC ANHYDRASE.

Submitted (JUL-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Putative odcraft receptor.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SUBCELLULAR ELOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
-!- DATABASE: NAME-Human Olfactory Receptor Data Exploratorium (HORDE);

-1- SUBCELLULAR LOCATION: Inner membrane-associated (By similarity).
-1- SUBLERITY: Belongs to the ABC transporter family. ModC subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.

Bacteriol: 185:2330-2337(2003).
-!- FUNCTION: Part of the ABC transporter complex modABC (TC 3.A.1.8)
involved in molybdenum import. Responsible for energy coupling to
the transport system (By similarity).
-!- CATALYTIC ACTIVITY: ATP + H(2)O + molybdate(Out) = ADP + phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Churcher C., Mungall K.L., Bentley S.D., Thomson N.R., Pickard D., Wain J. -!- FUNCTION: Required for the differentiation of the dorsal-venting pattern, and does not appear to be involved in the process of segmentation (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear (By similarity).

-!- SIMILARITY: Contains 1 homeobox domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ProDom; PD000010; Homeobox; 1.

Phylogenet. Evol. 22:144-154 (2002).

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or b660) is high-potential and absorbs at about 566 (By

SUBMUNT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô

"Phylogeny of all major groups of cetaceans based on DNA sequences
from three mitochondrial genes.";
Mol. Biol. Evol. 11:339-948(1994).

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-c1 complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis (By similarity).

-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or
b562) is low-potential and absorbs at about 562, and heme 2 (or b
cor b566), is high-potential and absorbs at about 566 (By

-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

-I- FUNCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-cl complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis (By similarity)

similarity).
SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
SIMILARITY: Belongs to the cytochrome b family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                83 IRON 1 (HEME BS62 AXIAL LIGAND)

"Evidence of a cenozoic Betic-Kabilian Connection based on freshwater lish phylogeography (Luciobarbus, Cyprinidae).";

Mol. Phylogenet. Evol. 18:252-263(2001).

-! FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (Complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!-COPACTOR: Binds two heme groups non-covalently. Heme I (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or BH or b552) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Echinodermata; Eleutherozoa; Echinozoa;

-!- SUBUNIT: The main subunits of complex b-c1 are: cytoc
cytochrome c1 and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Strongylocentrotus purpuratus (Purple sea urchin)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-APR-1990 (Rel. 14, Created)

631ycylpeptide N-tetradecancyltransferase (BC 2.3.1.97) (Peptide N-myristoyltransferase) (Myristoyl-CoA:protein N-myristoyltransferase)
coupled to ATP synthesis (By similarity).

COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or or b566) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

-!-FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or expochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!-COPACTOR, Binds two heme groups non-covalently. Heme I (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or or b566) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               similarity).
-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Hyperoartia,

Mol. Biol. Cell 8:157-170(1997).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBUNIT: Member of the multicomponent NFATC transcription complex that consists of at least two components, a pre-existing oypoplasmic component NFATCs and an inducible nuclear component NFATC1. Other members such as NFATC4, NFATC3 or members of the activating protein-1 family, MAF, GATA4 and Cbp/p300 can also bind the complex. NFATC proteins bind to DNA as monomers. SUBCELLULAR LOCATION: Cytoplasmic for the phosphorylated form and nuclear after activation that is controlled by calcineurinmediated dephosphorylation. Rapid nuclear exit of NFATC is thought to be one mechanism by which cells distinguish between sustained and transient calcium signals. The subcellular localization of NFATC play a key role in the gene transcription.
                                                                                          calcium-regulated and exhibits distinct DNA binding specificity."; J. Biol. Chem. 270:19898-19907(1995).

Complex. apolipoprotein B-enriched beta-VLDL, lipoprotein lipase,
Iactoferrin, clusterin and calcium.
FWNTION: Receptor-mediated uptake of polybasic drugs such as
aprotinin, aminoglycosides and polymyxin B.
Trustonin, aminoglycosides and polymyxin B.
Subunit: Forms a multimeric complex together with a receptor-
associated protein (RAP). Binds to ankyrin-repeat family A protein

                                                                                                                                                                                  SUBUNIT: Consists of a sigma factor and the RNAP core enzyme which is composed of 2 alpha chains, 1 beta chain, 1 beta' chain and 1 omega chain (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cullings K.W., Morafka D.J., Hernandez J., Roberts J.W.;
Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Component of the ubiquinol-cytcochrome c reductase complex (complex III or cytcochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or or b565) is high-potential and absorbs at about 566 (By
terminal regions of the beta' subunit thereby facilitating its interaction with the beta and alpha subunits (By similarity). CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mitochondrion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         similarity).
-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity)
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                SIMILARITY: Belongs to the RNA polymerase omega chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TIGR; VC2709; -... 1.

C. PUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
COPACTOR: Binds two heme groups non-covalently. Heme I (or BL b562) is low-potential and absorbs at about 562, and heme 2 (or b566) is high-potential and absorbs at about 566 (By

BYOL. 8:819-834(1991).

-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESPIRATORY CHAINT THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-!- COPACTOR: TWO HEME GROUPS (BSES AND BS66) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-CI ARE: CYTOCHROME B,
CYTOCHROME CI AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-1- COMPLEX TWO HEME GROUPS (BESC AND BS66) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

-1- SUBMINIT: THE MAIN SUBMINIS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME CI AND THE RIESER PROTEIN (BY SIMILARITY).

-1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

-1- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AND ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-1- COFACTOR: TWO HEME GROUPS (BS-C2 AND BS-G6) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).
-1- SUBMINIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
C-1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.
